                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                           Human hippocampal Y5 receptor (AAR95939) was identified as the homologue of rat hypothalamic Y5 receptor (AAR95940), isolated as an 'atypical Y1 receptor'. The receptor balongs to the G protain-coupled receptor superfamily. It is encoded by a cDNA clone (see also AAY30433) that was isolated from a hippocampus cDNA library using rat Y5 receptor cDNA as probe. Recombinant rat Y5 receptor can be produced in prokaryotic or eukaryotic (e.g. COS, 293 or Eff insect) host cells. It is used to identify Y5 ligands (agonists and antegonists) that can be used to treat obesity, bullimia or anorexia, and to raise monoclonal antibodies useful
                                                                     feeding behaviour using Y5 receptor (ant)agonists - increases ses food consumption, for treatment of e.g. obesity or bulimia

The present sequence represents human hippocampal neuropeptide (NP) Y receptor subtype Y5, with a pharmacological function associated with for example, obssity and eating disorders. The specification relates to a method of treatment and prophylaxis of disorders and diseases associated with with NPY receptor subcype Y5 comprising administering to a warm-blooded animal, including man, in need of such treatment a warm-herapeutically effective amount of a quinazolin-2,4-disazirine compound. These disorders and diseases include e.g. eating disorders, obseity, bulimia nervosa, diabetes, dyslipidaemia, hypertension, memory loss, sexual/reproductive disorders, depression, anxiety, cerebral haemorrhage, shock, congestive heart failure, nasal congestion or diarrhoea.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents human hippocampal neuropeptide (NP) Y receptor subtype Y5, with a pharmacological function associated with for example, obesity and eating disorders. The specification relates to a method of treatment and prophylaxis of disorders and diseases associated with with NPY receptor subtype Y5 comprising administering to a warm-blooded animal, including man, in need of such treatment a therapeutically effective amount of a new heteroaryl compound. These disorders and diseases include e.g. eating disorders, obesity, bulimia nervosa, diabetes, dyslipidaemia, hypertension, memory loss, epileptic seizures, depression, anxiety, cerebral haemorrhage, shock, congestive heart failure, nasal congestion or diarrhoea. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                               Human hippocampal neuropeptide Y Y5 receptor, NPY Y5; prophylaxis, bullmia nervosa; diabetes; dyslipidaemia; hypertension; memory loss; epileptic siezure; migraine; aleep disturbance; pain; depression; sexual disorder; anxiety; cerebral haemorrhage, shock; diarrhoea; congestive heart failure; eating disorder; obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 2385; DB 2; Length 455; 100.0%; Pred. Y5-r can be used in processes to determine whether a chemical compound specifically binds to and activates or inhibits a Y5-R by measuring a second messenger response. The chemical compounds can be used to increase or reduce the estivity of a Y5-R. In particular, inhibitors can be used to treat obesity and activators can be used to treat anorexial anorexial shit applies of alleviating (by decreasing the activity of Y5-R) an abnormality can be

identified by administering a potential antagonist to a transgenic mammal as above, and determining whether the substance alleviates the physical and behavioural abnormalities displayed by the transgenic mammal as a result of overactivity of a Y5-R. Agonists can be identified in a similar manner, but where the abnormality is alleviated by increasing the activity of Y5-R

                                                                                     The present sequence represents the human hippocampal Y5 receptor. The Y5 teceptor is a G-protein coupled neuropeptide Y receptor found throughout the mammalian nervous system and is a powerful stimulant of feeding behaviour. Cells expressing DNA encoding the Y5 receptor can be used to determine whether a ligand specifically binds to a Y5 receptor. These cells or a cell extract, is exposed to the ligand and then any binding between the ligand and the receptor can be detected. The cells can also be used to determine whether a ligand is a Y5 receptor can also agonist. The binding of chemical compounds to a Y5 receptor can also determined and whether they activate or inhibit the activation of the Y5 receptor can also be determined using cells expressing the receptor. The antagonists can also be detected with these cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

New chimeric receptor proteins comprising a single polypeptide chain of amino acids, useful as targets for drug actions, and as basis for drug discovery and development.

Example 2; Page 55-56; 72pp; English.

The present invention relates to chimeric neuropeptide Y (NPY) receptors. The NPY receptors are G-protein-coupled transmebrane proteins with seven membrane proteins with seven membrane spanning transmembrane. (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, highlow blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug atlons, and as basis for drug disorvery and development. The NPYS receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is human NPYS receptor

This invention describes a novel method of modifying feeding behaviour of a subject which involves administering to the subject an amount of a compound which is a Ys receptor agonist or antagonist effective to increase or decrease, respectively, the consumption of food by the subject so as to modify feeding behaviour of the subject. The product of the invention has metabolic, anorectic, antidepressant, tranquiliser, antidigratine, analgesto, hypotensive, creabroprotective, cardiant, antidigratine, analgesto, hypotensive, creabroprotective, cardiant, antidigratine, analgesto, anorectic antidipressant, tranquiliser, antidigration and haemostatic activity and can be used in a vaccine. Ys receptor agonist or antagonist compounds are useful for treating an abnormality alleviated by the inhibition or activation of Ys receptor, in a subject. Antibodies raised against the receptor are useful for treating an abnormality alleviated by the inhibition or activation of Ys receptor, in a subject. Antibodies raised against the receptor are useful for treating an appormality in a subject, where the abnormality includes anioraxia, sexual/reproductive disorder, depercation, anxiety, memory loss, migraine, pain, epileptic sizulure, hypertension, anxiety, memory loss, migraine, pain, epileptic failure, sleeve disturbance, nasal congestion, and diarrhoea. This secures of the inventing in the stream of the invention of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

The present sequence is the protein sequence for the human neuropeptide (S (NPYS) receptor. In an example from the invention, chimeric receptors including human NPS receptor sequences were constructed, and used to assay the binding activity of compounds of the invention. Substituted spiro(isobenzofuran-1,4'-piperidin) 3-ones and 3H-spiroisobenzofuran-1,4'-piperidines capable of modulating NPS receptor activity are provided. Such compounds may be used to modulate ligand binding to NPS receptors in vivo or in viro, and are particularly useful in the treatment of a variety of disorders, eg. eating disorders such as obesity or bulimia, psychiatric disorders, diabetes and cardiovascular disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 VSLLGFWGNLLILMALMKKRNQKTTVNFLIGNLAFSDILVVLFCSPFTLTSVLLDQWRFG 120

This invention relates to novel ligands (derivatives of 2-cyclohexyl-4-phenyl-1H-imidazole) for the neuropeptide V5 (RPV5) receptor. The NPV5 receptor mediates a variety of physiological effects and is involved in appetite regulation, hormone release and blood pressure. Ligands that modulate the NPV5 receptor inhibit or enhance NPV binding such that they can be used to treat a variety of conditions including feeding disorders (obestry and bulinia), psychiatric disorders, diabetes and cardiovascular diseases such as hypertension. Further uses relate to to the treatment of cerebral infarction, epilepsy, sofhizophrenia, despession, angina, sudden cardiac death, vasospasm, arkhythmia, urinary incontinence, Crohn's disease and asthma. As such these ligands can be described variously as enerolaging, animimaliammatory, mootropic, vasotropic, anticonvulsant and uropathic. This polypeptide sequence is the human neuropeptide YS (NPYS)
New 2-cyclohexyl-4-phenyl-1H-imidazole derivatives are modulators of neuropeptide Y5 receptor activity, useful for treating e.g. eating or psychiatric disorders.
                                                                                                                                                                                                                                                   Example 10; Page 39-41; 63pp; English.

The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to compound the sequences at least 90% identical to the GPCR proteins and nucleic acids of the invention, methods of screening for associated with GPCRs of the invention, methods of screening for compounds useful in the treatment of GPCR related diseases, at transgenic compounds useful in the treatment of GPCR related diseases, at transgenic compounds useful in the treatment of GPCR related diseases, at transgenic mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transgene or in an endogenous GPCR gene; cells derived comprising a mice; kits comprising several mice, ach of which has a mutation in a different GPCR gene of the invention; and kits comprising comprising a which hybridise to GPCR polymocleotides of the invention. The invention further discloses variants of the GPCR polymocleotides and vectors comprising a GPCR nucleic acid. The GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of discasses including neurological disorders (e.g., Alzhaimer's disease, deprending on trintable bowel closuscens of the adrenal gland; disorders of the colon or intestines; grandome); cardiovascular disorders (e.g., autoimmune disorders (e.g., and macmia or leukaemia); immune disorders; (e.g., autoimmune disorders (e.g., autoimmune disorders (e.g., autoimmune disorders (e.g., autoimmune disorders (e.g., osteoarthritis, protein disorders (f.the kidney, liver, lung, breast, ovary, obseity, protein teleficiency-related diseases or vitamin deficiency-related diseases); and disorders of the kidney, liver, lung, breaset obseity, and officency-related diseases or vitamin Novel mammalian G protein coupled receptors, useful for identifying compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina Claim 151; SEQ ID NO 666; 542pp; English. electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. pectoris, Parkinson's disease. The present invention relates to chimeric neuropeptide Y (NPY) receptors. The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and control of limbic seizures. The present sequence is african green monkey (AGM) NPYS receptor ö receptor proteins comprising a single polypeptide chain of useful as targets for drug actions, and as basis for drug Neuropeptide Y; NPY receptor; G-protein-coupled transmembrane protein; transmembrane; TM domain; therapy; obesity; blood pressure; eiplepsy; thuntington's disorder; Parkinson's disorder; eating disorder; seizure; locomotor; anxiety disorder; limbic seizure; tranquilliser; 361 RVKRSVTRIKKRSRSVFYRLTILILVFAVSWMPLHLFHVVTDFNDNLISNRHFKLVYCIC .. 0 Length 455; African green monkey (AGM) neuropeptide Y5 (NPY5) receptor. A novel human receptor for the neurotransmitters neuropeptide Y (NPY) and peptide YY (PYY) is designated NPY YS receptor. Its amino acid sequence was deduced from a human genomic DNA clone (see AAT87940). Rat NPY YS has also been identified (see AAW27602.03). These polypeptides can be expressed in host (e.g. human 293) cells. The effects of NPY include blood pressure regulation, memory enhancement, anxiolysis/sedation and increased food intake. The receptor can therefore be used to screen for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                            A novel human neuropeptide Y (NPY)-Y1-like receptor (AAM15230), designated NPY-Y5 receptor, is a G-protein coupled receptor of NPY, which is involved in appetite-obesity regulation. Its amino acid sequence was deduced from isolated genomic (AAT66909) and foetal brain cDNA (AAT66910) sequences. Rat (AAM12232) and mouse (AAM12233) NPY-Y5 receptors have also been identified. NPY-Y5 receptors can be expressed on the cell surface of host (pref. CHO, human embryonic kidney 293 or insect Sf9) cells. The receptors or host cells can be used to screen for NPY (ant)agonists useful as potential hypotensives, cardiovascular drugs, neuronal growth factors, anti-psychotic, anti-obesity or anti-diabetic drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          130

(SCHE) SCHERING CORP.

Parker EM, Rudinski MS, Strader CD;

WPI; 2000-012792/01. N-PSDB; AAZ46232. Chimeric mammalian neuropeptide Y5 receptor polypeptides useful for treating a range of disorders including jet lag, hypertension and sexual disfunction.

Example; Col 37-40; 24pp; English.

This sequence represents human neuropeptide Y (NPY) Y5 receptor, CDNA encoding which was isolated and amplified from a human neuroblastoma cell line using primers A24615-24623. The receptor was transiently expressed in COSI calls, but its level of expression was found to be significantly lower in comparison to that of the rat NPY Y5 receptor (AAY52579). The invention relates to a chimeric rat/human NPY receptor, comprising the 5' untranslated region (5' UTR) and extreme 5' coding region (105 bp) of the rat Y5 receptor CDNA, appended to mucleotides 365-commeric construct yielded levels of expression higher than the name y5 receptor. The pharmacological properties of the chimeric cative rat Y5 receptor. The pharmacological properties of the chimeric receptor were similar to these of the naive human Y5 receptor. NPY is widely distributed in both the peripheral and central nervous systems and cative thermogenesis, blood pressure, hormone release, gut motility, smooth muscle tone, sleep and circadian rhythms, neuronal excitability, conciception, mood and emotional responses. NPY mediates these concipied receptors (designated Y1-Y6): The Y5 receptor mediates concident coupled receptors (designated Y1-Y6): The Y5 receptor mediates concident coupled receptors (designated Y1-Y6): The Y5 receptor mediates concident coupled receptors (designated Y1-Y6): The Y5 receptor mediates concident coupled receptors (designated Y1-Y6): The Y5 receptor mediates concident acceptor, associated mucleic acids (e.g., expression excitability and seizure activity, diuresis, natriuresis and calciuresis. The chimeric Y5 receptor, associated mucleic acids (e.g., expression excitability and calculars such as abosity, hypertension, epilepsy, sexual dysfunction and citates and associated with abnormal expression/activity of NPY

"Molecular biology and pharmacology of multiple NPY Y5 receptor
species homologs";
T species homologs";
T species homologs ";
T species homologs activity seems to be associated with food intake. Could be involved in feeding disorders (By similarity).

-: SUBCELDULAR LOCATION: Integral membrane protein.

-: SUBCELDULAR LOCATION: receptors.

-: SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

Highest to tachykinins receptors.

Tassociated with feeding behavior.";

J. Biol. Chem. 27126315-26319 (1996)

I. J. FORTION: Receptor for neuropeptide Y and peptide YY. The activity of this receptor is mediated by G proteins that inhibit adenylate of this receptor is mediated by G proteins that inhibit adenylate cyclass activity. Seems to be associated with food intake. Could be involved in feeding disorders.

C. I. SUBCELLULAR LOCATION: Integral membrane protein.

TISSUES PECIFICITY: Brain, hypothalamus.

C. I. MIRARIY: Belongs to family 1 of G-protein coupled receptors.

Highest to tachykinins receptors.

SUBMILLED GEORGE TO THE EMBL/Genbank/DDBJ databases.

ILO YOUNG (CCT-1998) to the EMBL/Genbank/DDBJ databases.

ILO YOUNG (CCT-1998) to the EMBL/Genbank/DDBJ databases.

ILO YOUNG TON: Receptor for neuropeptide Y and peptide YY. The activity of this receptor is mediated by G proteins that inhibit adenylate of cyclase activity. Seems to be associated with food intake. Could be involved in feeding disorders (By similarity).

ILO SIMILARITY: Belongs to family in G G-protein coupled receptors.

Highest to tachykinins receptors. Mraith A., Tornsten A., Chardon P., Harbitz I., Chowdhary B.P., Wraith A., Tornsten A., Chardon P., Harbitz I., Chowdhary B.P., Andersson L., Larhammar D., "Porcine NPY receptors NPYIR, NPY2R and NPY5R: cloning, mapping and Extracellular (Potential).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4,
